It is a simple macro extension that was developed and is a fork of Ken Moirik's original GitHub project. It was designed to enhance Lightroom's Edit and Make profiles, as well as working with our 'baked' photo filters. The plugin lets users select one or more photo that they want to 'apply' one or more of the photo filters on, for instance, oil, drop, etc. It

includes one and two step presets, which are composed by users on the basis of two options that can be set, namely an image channel and a preset file. With regard to the preset file, this can contain multiple layers, such as the one of three color filters in three layers, with one layer defining how the filter should be applied on each individual photo. It also enables users to include additional layers and filters, and the way to work with them depends on the options that are chosen. As an example, if one wants to use the oil filter, they can choose whether or not the option should apply it only to the red layer, only to the green layer, only to the blue one, and so on. Additionally, it lets users save the current settings as a preset, so that the same settings can be reused for future photo. In order to set this macro, users can see the main interface and select the desired channel or preset file, or if they wish to select all of them, simply press the 'Add Filter' button. Then, when they are done, they can hit the 'Apply Filter' button, which will select all of the photos, and subsequently apply the selected filter, for instance, one that works as a specific effect to a specific photo.

It can be used to easily create a bunch of custom editing presets, which can be uploaded to the online photo service. The plugin makes it possible to specify a set of parameters for a group of presets, which are used to modify the input image. The task is relatively easy, as it only requires three options that can be configured, namely the name of the preset, the image channel and the targeted photo. Each preset can be saved as a standalone file, so users can select more than one and have them easily accessible. For instance, when a 1d6a3396d6
